4. Quad Core is designed to improve performance of certain software products. Not all customers or software applications will necessarily benefit from use of this technology 64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled 64 architecture. Processors will not operate (including 32-bit operation) without an Intel 64 architecture-enabled BIOS. Performance will vary depending on your HW and SW configurations. See [www.intel.com/info/em64](http://www.intel.com/info/em64) Intel’s numbering is not a measurement of higher performance. Some functionality of this technology, such as Intel Active management technology and Intel Virtualization technology, requires additional 3rd party software in order to run. Availability of future “virtual appliances” applications for Intel vPro technology is dependant on 3rd party software providers. Compatibility with future “virtual appliances” and Microsoft Windows Vista and Windows 7 operating systems is yet to be determined.

5. Full availability of 4 GB or more of memory requires a 64-bit operating system. With Windows 32-bit operating systems, the amount of usable memory is dependent upon your configuration, so that above 3 GB all memory may not be available due to system resource requirements.

6. For hard drives, 1 GB = 1 billion bytes. Actual formatted capacity is less. Up to 15 GB of system disk is reserved for system recovery software.
